The present invention relates to novel DNA and protein sequences which are associated with carcinomas. The sequences are useful for: (i) for screening drug candidates, (ii) for screening of bioactive agent capable of binding to Carcinoma Associated Protein (CAP), (iii) for screening of a bioactive agent capable of modulating the activity of CAP; (iv) for adagnosing the effect of a candidate carcinoma fung; (v) for diagnosing carcinoma; (vii) for neutralizing the effect of CAP; (ix) as a biochip; (x) for diagnosing carcinoma or a propensity to carcinoma; and (xi) for determining Carcinoma Associated (CA) gene copy number. In addition, the CA genes are useful as DNA vaccines and the CAP are useful as markers of carcinoma including lymphoma. The present sequence is one such CAP. Note: This patent is an equivalent to basic patent US2002182586A1, for which no sequence data was published

The nucleotides and polypeptides are useful as diagnostic markers or therapeutic target for the diseases or morbid states. They are also useful for treating osteoporosis, neurological diseases, Alzheimer's diseases, Parkinson's diseases, dementia and various cancers. This sequence corresponds to a protein sequence of the invention.

Specific antibodies and small molecules capable of modulating the interaction between interleukin 2 (II common gamma chain (cgammac) and NIK kinase (NIKK) are useful for the manufacture of a medicament for the treatment of a disease, e.g. a disease resulting from excessive immune response such as rheumatoid arthritis, osteoarthritis, inflammatory bowel disease, asthma, cardiac infarct, Alzheimer's disease or atherosclerosis; or an autoimmune disease such as immune thyroiditis, or other arthropaties, such as autoimmune thaemolytic anemia. The small molecule is useful for modulating signaling through cgammac. The present sequence represents a human NIK fragment
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New nuclear factor inducing kinase or its mutein, variant, fusion protein, functional derivative, circularly permutated derivative or fragment, useful for treating an autoimmune disease, infarct, Alzheimer's

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          C --- FUNCTION: Lymphotoxin beta-activated kinase which seems to be exclusively involved in the activation of NF-kappa-B and its transcriptional activity. Induces the processing of NF-kappa-B (2 /P100. Could act in a receptor-selective manner.

--- STBURIT: Binds to TRAFE, TRAFE, TRAFE, IKKA and NF-kappa-B 2/P100. Interacts with PELI3 (By similarity).

--- SUBCELDULAR LOCATION: Cytoplasmic.

--- SUBCELDULAR LOCATION: Cytoplasmic.

--- FTM: Autophosphorylated.

--- DISEASE Defects in Map3/14 are the cause of alymphoplasis (ALY) which is characterized by systemic absence of lymph nodes and peyer's patches and disorganized splenic and thymic structures with immunodeficiency.

--- SIMILARITY: Belongs to the Ser/Thr protein kinase family. MAP kinase kinase kinase subfamily.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          [2]

-!- TISSUE SPECIFICITY: Expressed in several normal tissues and human tumor-derived call lines.
-!- DEVELOPMENTAL STAGE: The 58 kDa form is activated specifically during the 5 and G2/M phases of the cell cycle.
-!- PTM: Autophosphorylared. The longer form undergoes phosphorylation on Ser residues mainly, and the shorter form on both Ser and Thr

Jpn. J. Cancer Res. 84:518-525(1993).
-!- Cancer Res. 84:518-525(1993).
-!- Cancer Res. 84:518-525(1993).
-!- CATALYTIC Able to activate NF-kappa-B 1 by stimulating proteasomemediated proteolysis of NF-kappa-B 1/pl05. Plays a role in the cell cycle (By similarity).
-!- CATALYTIC ACTIVITY: ATP + a protein = ADP + a phosphoprotein.
-!- SUBUNIT: Interacts with NFKB1/pl05.
-!- SUBCELLUAR LOCATION: Cytoplasmic.
-!- SUBCELLUAR LOCATION: Cytoplasmic.
-!- TISSUE SPECIFICITY: High in adult submandibular gland, thymus, spleen and newborn digestive tract.
-!- PTM: Autophosphorylated (By similarity).
-!- PTM: Autophosphorylated (By similarity).
-!- SIMILARITY: Belongs to the Ser/Thr protein kinase family. MAP kinase kinase kinase subfamily.

Plays a role in the cell cycle.
-!- CATALYTIC ACTIVITY: ATP + a protein = ADP + a phosphoprotein.
-!- SUBGNIT: Interacts with NFKB1/p105.
-!- SUBCELLULAR LOCATION: Cytoplasmic.

SPECIFICITY: Expressed in spleen, thymus, liver and lung.
                     PTM: Autophosphorylated.
SIMILARITY: Belongs to the Ser/Thr protein kinase family. MAP
kinase kinase kinase subfamily.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Craniata; Vertebrata; Euteleostomi;

                                                                                                                                                                                                                                                                                                         -!- SUBUNIT: Binds both upstream activators and downstream substrates in multimolecular complexes through its N-terminus.
-!- TISSUE SPECTIFICITY: Highly expressed in the heart and spleen while a lower level expression is seen in the liver.
-!- PTM: Autophosphorylated.
-!- SIMILARITY: Belongs to the Ser/Thr protein kinase family. MAP kinase kinase kinase subfamily.
-!- SIMILARITY: Contains 1 SWIM-type zinc finger.
-!- SIMILARITY: Contains 1 SWIM-type zinc finger.

Fails to induce activation of the AP-1
ranscription factor, MapK7 or MAPK8.
I-5A: Loss of autophosphorylation. Fails
to induce activation of the AP-1
transcription factor, MAPK7 or MAPK8.
T-5A: Loss of autophosphorylation and
fails to induce activation of the AP-1
transcription factor, MAPK7 or MAPK8 when
associated with Ala-575 and Ala-576.
Q-5A: Loss of autophosphorylation and
fails to induce activation of the AP-1
transcription factor, MAPK7 or MAPK8 when
associated with Ala-574 and Ala-576.
P-5A: Loss of autophosphorylation and
fails to induce activation of the AP-1
transcription factor, MAPK7 or MAPK8 when
associated with Ala-574 and Ala-576.
P-5A: Loss of autophosphorylation and
fails to induce activation of the AP-1
transcription factor, MAPK7 or MAPK8 when
associated with Ala-575 and Ala-576.
P-5A: Loss of autophosphorylation and
fails to induce activation of the AP-1
transcription factor, MAPK7 or MAPK8 when
                  similarity)
SUBUNIT: Binds both upstream activators and downstream substrates
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       autophosphorylation when associated with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    autophosphorylation when associated with

                                                                                                                                          -!- FTM: Autophosphorylated.
-!- SIMILARITY: Belongs to the Ser/Thr protein kinase family.
-kinase kinase subfamily.
-!- SIMILARITY: Contains 1 RING-type zinc finger.
-!- SIMILARITY: Contains 1 SWIM-type zinc finger.
